SDDC Manager Inventory-State Known Issues After a vCenter Regeneration

Prepared by: Virtual Control LLC **Date:** June 8, 2026 **Document Version:** 1.0 **Classification:** Internal **Platform:** VMware Cloud Foundation 9.0.1

Scope. Three SDDC Manager management-plane conditions observed after the management vCenter was regenerated and NSX was rebuilt out-of-band: (1) vCenter stuck `ACTIVATING` , (2) NSX missing from SDDC Manager inventory, (3) the SoS "Health-Check operation for SDDC" failing every cycle. This record captures each one's symptom, root cause, the evidence, everything attempted, and the **disposition** — so the conditions are tracked and not re-investigated.

Bottom line up front. None of the three is an outage — every workload, vCenter, NSX, vSphere/VCF Operations function normally. Issue 3 is a **known, ignorable VCF 9.0 defect**. Issues 1–2 are an SDDC Manager Platform-DB inconsistency for which **no VCF-9 self-service procedure exists**; the documented fix is Broadcom-assisted DB cleanup or a clean rebuild. **Decision: accept and document; do not attempt unguided DB edits.**

1. Environment

Item	Value
Platform	VMware Cloud Foundation 9.0.1

Item	Value
SDDC Manager	sddc-manager.lab.local / 192.168.1.241 (v9.0.1.0.24962180)
Management vCenter	vcenter.lab.local / 192.168.1.69 (9.0.1)
NSX	nsx-vip.lab.local (.70) / nsx-manager (.71)
VCF Operations	vcf-ops.lab.local / 192.168.1.77
Domain	mgmt (MANAGEMENT) — status ACTIVE

2. Common Root Cause

All three conditions descend from one event: the management **vCenter was regenerated** (VMCA root ~2026-05-10, machine-SSL leaf ~2026-05-13, with SSO and SSH host key changing at the same time) and **NSX was rebuilt out-of-band** (outside the SDDC Manager workflow). SDDC Manager's inventory and activation state never reconciled to the rebuilt components, leaving an orphaned NSX inventory object and a vCenter activation that never completed.

The trust-layer fallout (VCF Operations adapters, SDDC Manager UI "initializing") was repaired separately (see companion docs). What remains are **inventory/state records inside SDDC Manager** that supported tooling cannot reconcile.

3. Issue 1 — vCenter Stuck ACTIVATING

- **Symptom.** `GET /v1/vcenters` reports `vcenter.lab.local` → **ACTIVATING** and never transitions to **ACTIVE**.
- **Root cause.** A vCenter activation that began during the regeneration aftermath never completed; the inventory state is stuck in the transitional value. No corresponding in-progress task exists in `/v1/tasks`.
- **Impact.** Gates SDDC Manager lifecycle workflows for the domain and trips the SoS guardrail (Issue 3). **No impact to running workloads or to vCenter itself.**
- **Disposition. Accept** — no VCF-9 self-service procedure clears it (see §7).

4. Issue 2 — NSX Missing From SDDC Manager Inventory

- **Symptom.** `GET /v1/nsxt-clusters` returns **count 0**, yet the `mgmt` domain still references NSX cluster `c278c693-9489-4cb8-b585-1844ffdd3b1d` / `nsx-vip.lab.local`, and NSX credentials are present.
- **Root cause.** NSX was rebuilt out-of-band; SDDC Manager retains an **orphaned/stale NSX cluster object** in its Platform database — referenced and credentialed, but not enumerated.
- **Impact.** Surfaces the compliance finding "*SDDC is missing VCF component NSX*" (KB 314608) and blocks NSX lifecycle through SDDC Manager. **NSX itself is healthy and serving** (VIP + node reachable; the `nsx-manager` VCF Operations adapter collects ~2,440 metrics).
- **Disposition. Accept** — the documented fix is Broadcom-assisted Platform-DB cleanup; no self-service procedure for VCF 9 (see §7).

5. Issue 3 — SoS Health-Check Fails Every Cycle

- **Symptom.** "Health-Check operation for SDDC" fails every ~5 minutes at **Pre-Validation** with "Error occurred during Active workflow pre-validation check... the system could be in a transitional state."
- **Root cause.** The SoS API has a **guardrail** that fails the health-check if it detects an active/transitional workflow. In VCF 9.0 it trips spuriously.

Resolution — known, ignorable VCF 9.0 defect. Broadcom **KB 391741** states verbatim: "This is a known issue in VCF 9.0 and can be ignored. A fix is planned for a future update." **No action required.** (Optional, not recommended: lower `vcf_sos_api_call_retry_count` in `VMwareInfraHealth.properties` on the VCF Operations nodes only to reduce repeated failed-task noise.)

6. What Was Attempted (All of It)

Every supported, low-risk step was tried before concluding "accept":

Action	Result
<code>sddcmanager_restart_services.sh</code> (full services restart)	Resumed the dormant scheduler; did not clear ACTIVATING/NSX
vCenter service restart + full reboot	No change to inventory state
Completed the previously-hung "Downloading Esx metadata" task	Completed <code>SUCCESSFUL</code> ; vCenter still <code>ACTIVATING</code>
VCF Operations UI → Sync Inventory	Blocked — "Service or view not available" (the VcfAdapter is at 0 metrics)
API version-sync (<code>POST /v1/resources/version-syncs</code>)	Ran, then Failed/no effect ; <code>nsxt-clusters</code> still 0
Verified NSX reachability + credentials	NSX healthy; credentials present — ruled out a simple credential/connectivity fault

7. Why No Self-Service Fix — Procedures Evaluated

Each candidate Broadcom procedure was checked against this exact case:

Procedure	Applies?	Why
KB 407866 — ACTIVATING via personality-file download	✗	That download already completed <code>SUCCESSFUL</code> ; vCenter still <code>ACTIVATING</code>
KB 343400 — remove a failed workflow (<code>curl -X DELETE localhost/tasks/registrations/<id></code>)	✗	Requires a stuck task/workflow ID; <code>/v1/tasks</code> shows none non-terminal
KB 313210 — SDDC Manager recovery scripts	✗	Scripts are for VCF 3.9–5.0 , not VCF 9

Procedure	Applies?	Why
KB 425835 / version-sync (324050) — inventory/version sync	✗	UI action blocked (VcfAdapter down); API version-sync had no effect
KB 419613 / 402093 — stale Platform-DB entries	⚠ SR	Broadcom guidance: engage Global Support to clear the stale DB entry — not self-service

Conclusion. For VCF 9, clearing an orphaned NSX inventory object / stuck `ACTIVATING` state is a **Broadcom-assisted Platform-DB cleanup (SR)** or a **clean rebuild. No documented self-service procedure fits.** Per the operating rule — only a specific KB-documented procedure, never an improvised database edit — **nothing safe and prescribed exists to run**, so the conditions are left in place.

8. Disposition & Conditions to Revisit

- **Issue 3 (SoS Health-Check): Closed as known issue** (KB 391741) — ignore; resolves with the future VCF patch.
- **Issues 1 & 2 (ACTIVATING / NSX inventory): Accepted and documented.** No safe VCF-9 self-service fix; not an outage.
- **Compensating control:** keep **DRS at Partially Automated** so DRS does not auto-vMotion vCenter/NSX across the degraded nested storage (this was the cause of a separate HA cascade on 2026-06-05).
- **Revisit when any of these become true:**
- A **clean rebuild / re-import** of the management domain is performed (inventory is recreated correctly then) — the real fix.
- **Broadcom support** becomes available (open an SR with §9 evidence for the Platform-DB cleanup).
- A **VCF 9.0.x patch** ships the KB 391741 SoS fix (clears Issue 3 automatically).

9. Evidence Appendix (Verified, Read-Only)

```

GET /v1/vcenters          -> vcenter.lab.local : ACTIVATING
GET /v1/nsxt-clusters     -> count: 0
GET /v1/domains           -> mgmt : ACTIVE
                           nsxtCluster ref = c278c693-9489-4cb8-b585-1844ffdd3b1d / nsx-vip.lab.local
GET /v1/credentials?resourceType=NSXT_MANAGER -> 4 present
  admin (API, SYSTEM) · root (SSH, SYSTEM) · audit (AUDIT, SYSTEM)
  svc-sddc-manager-nsx-vip-9971 (API, SERVICE)
NSX reachability          -> nsx-vip .70:443 OPEN · nsx-mgr .71:443 OPEN
VCF Operations adapters  -> nsx-manager 2,440 metrics · vcenter 2,759 · vSAN 418
                           VcfAdapter "VCF 9" = 0 metrics (blocks UI Sync Inventory)
SoS Health-Check          -> Failed Pre-Validation "Active workflow / transitional state" every ~5 min
version-sync              -> POST /v1/resources/version-syncs {resourceType:SYSTEM} -> ran, no effect

```

11. Document Information

Field	Value
Title	SDDC Manager Inventory-State Known Issues After a vCenter Regeneration
Document ID	VC-KI-SDDC-INVENTORY-STATE-20260608
Version	1.0
Issued	2026-06-08
Author	Virtual Control LLC
Classification	Internal
Platform	VMware Cloud Foundation 9.0.1
Applies to	SDDC Manager ACTIVATING / orphaned NSX inventory / SoS Health-Check failure after a vCenter regeneration + out-of-band NSX rebuild
Primary references	KB 391741, 407866, 343400, 313210, 419613, 402093, 425835, 324050, 314608, 316028
Distribution	Lab notebook

Revision History

Version	Date	Notes
1.0	2026-06-08	Initial issue. Records the three post-regeneration SDDC Manager inventory-state conditions (vCenter ACTIVATING, NSX missing, SoS Health-Check failure), the common root cause, the full list of attempted remediations, the evaluation of every candidate Broadcom procedure (none applicable to VCF 9 self-service), the KB 391741 finding that the SoS failure is an ignorable VCF 9.0 known issue, the read-only evidence appendix, and the accept-and-document disposition with conditions to revisit. No changes were made to the environment; no snapshot taken.
